

PROFESSIONAL SUMMARY

Cloud and Platform Engineer who has spent the last few years deeply focused on one thing — making sure software gets from code to production securely and reliably. Works across the full delivery lifecycle, from locking down supply chains and enforcing artifact integrity to keeping Kubernetes platforms observable and resilient across multi-cloud environments. Brings hands-on experience in infrastructure automation and GitOps-driven delivery, with a strong belief that security should be built in from the start, not bolted on at the end and the platform team exists to make that easy for every developer.

CORE SKILLS

Cloud & IaC: AWS | Azure | Terraform | IaC | Compliance-as-Code

Architecture & OS: VPC | Load Balancing | Linux | PowerShell

DevOps: Agile SDLC Automation | GitHub Actions | Jenkins | ArgoCD

Containers: Containerization | Docker | Kubernetes (kubeadm) | Helm

Security: IAM | Trivy | Cosign | Kyverno | Falco | Network Policies | Istio (mTLS)

DevSecOps: SBOM | SLSA | Image Signing | Supply Chain Security | Policy-as-Code

Observability: Prometheus | Grafana | Loki | ELK Stack

Programming: Python | JavaScript | Bash

PROFESSIONAL EXPERIENCE

Cloud & DevSecOps Engineer (Remote, Contract) | 2024 – 2026 | Fintech & cloud clients, multiple environments

- Designed and provisioned AWS infrastructure using **Terraform** including VPCs, IAM, compute, and Kubernetes clusters with **reusable modules** and **self-service patterns** for scalable multi-environment systems
- Designed multi-environment cloud architecture (**dev/staging/prod**) with isolated networking, **IAM access controls**, and secure deployment patterns
- Built and maintained Kubernetes-based **microservices platforms (10+)** using Docker, Helm, and ArgoCD with **GitOps workflows**, achieving **99.99% uptime** across client deployments
- Implemented **CI/CD pipelines** using GitHub Actions and Jenkins, reducing manual deployment effort by **70–80%**
- Strengthened **system security** and **Compliance** using IAM least-privilege policies, Trivy scanning, and Kubernetes NetworkPolicies, reducing misconfiguration risks, achieving 100% audit compliance across client environments
- Cut **MTTR by 25%** through centralized **monitoring** and visibility (**Prometheus, Grafana, ELK**).
- Optimized cloud resource usage** through **right-sizing** and **provisioning**, reducing unnecessary infrastructure overhead

Software Engineer — Cloud & Infrastructure (Contract, On-site & Remote) | 2021 – 2024 | Web & cloud software house

- Deployed and maintained production web applications on **Linux servers**, managing compute, networking, and storage end-to-end
- Managed **REST APIs** and **backend services** in production using PM2/systemd, ensuring reliable uptime and fast incident response
- Containerized applications with **Docker** and transitioned **monolithic** systems to **modular** service-based architecture for improved scalability
- Implemented basic **CI/CD workflows** and environment configuration management across **dev and production servers**

PROJECTS

1 – Secure Software Supply Chain (DevSecOps Platform) – [Github : [LINK](#)]

- Built a secure software supply chain enforcing **cryptographic trust**, ensuring only verified container images are deployed to Kubernetes
- Implemented **vulnerability scanning**, **SBOM generation**, and **keyless image signing** (Cosign + OIDC) to establish trusted build artifacts
- Enforced **SLSA provenance** and **Kyverno admission** policies to block tampered or non-compliant workloads
- Integrated **Falco runtime security** to detect post-deployment anomalies and suspicious container activity
- Designed GitOps workflow with **ArgoCD** using immutable image digests, ensuring fully **auditable deployments**
- Established **multi-layer security** across build, admission, and runtime — preventing unauthorized workloads in production

2 – Production-Grade Kubernetes Platform (Self-Managed, Multi-Cloud) – [GitHub: AWS: [LINK](#) | Azure / DO: [LINK](#)]

- Built self-managed Kubernetes cluster (kubeadm) on AWS with **multi-node architecture** for full control over networking and scheduling
- Designed and provisioned **cloud infrastructure** using **Terraform** across networking, compute, IAM, and load balancing components
- Deployed microservices architecture (**8–12 services**) using Docker and Helm
- Implemented **GitOps** workflows using ArgoCD for automated and version-controlled deployments
- Applied security controls using **NetworkPolicies**, **IAM**, and **Trivy** to reduce insecure deployments
- Implemented **observability stack** (Prometheus, Grafana, Loki) for **monitoring and centralized logging**
- Extended architecture across **Azure and DigitalOcean** ensuring consistent multi-cloud deployment strategy

EDUCATION

Bachelor of Science in Computer Science (2019 – 2023)

Comsats University Islamabad — Pakistan
